3 Introduction

Decomposing a system into modules is a commonly accepted approach to developing software. A module is a work assignment for a programmer or programming team (**?**). We advocate a decomposition based on the principle of information hiding (**?**). This principle supports design for change, because the "secrets" that each module hides represent likely future changes. Design for change is valuable in SC, where modifications are frequent, especially during initial development as the solution space is explored.

Our design follows the rules layed out by **?**, as follows:

- System details that are likely to change independently should be the secrets of separate modules.
- Each data structure is implemented in only one module.
- Any other program that requires information stored in a module's data structures must obtain it by calling access programs belonging to that module.

After completing the first stage of the design, the Software Requirements Specification (SRS), the Module Guide (MG) is developed (**?**). The MG specifies the modular structure of the system and is intended to allow both designers and maintainers to easily identify the parts of the software. The potential readers of this document are as follows:

- New project members: This document can be a guide for a new project member to easily understand the overall structure and quickly find the relevant modules they are searching for.
- Maintainers: The hierarchical structure of the module guide improves the maintainers' understanding when they need to make changes to the system. It is important for a maintainer to update the relevant sections of the document after changes have been made.
- Designers: Once the module guide has been written, it can be used to check for consistency, feasibility, and flexibility. Designers can verify the system in various ways, such as consistency among modules, feasibility of the decomposition, and flexibility of the design.

The rest of the document is organized as follows. Section 4 lists the anticipated and unlikely changes of the software requirements. Section 5 summarizes the module decomposition that was constructed according to the likely changes. Section 6 specifies the connections between the software requirements and the modules. Section 7 gives a detailed description of the modules. Section 8 includes two traceability matrices. One checks the completeness of the design against the requirements provided in the SRS. The other shows the relation between anticipated changes and the modules. Section 9 describes the use relation between modules.

4 Anticipated and Unlikely Changes

This section lists possible changes to the system. According to the likeliness of the change, the possible changes are classified into two categories. Anticipated changes are listed in Section 4.1, and unlikely changes are listed in Section 4.2.

4.1 Anticipated Changes

Anticipated changes are the source of the information that is to be hidden inside the modules. Ideally, changing one of the anticipated changes will only require changing the one module that hides the associated decision. The approach adapted here is called design for change.

AC1: The supported hardware device platforms and versions.

AC2: The API endpoints on the server.

AC3: The supported in-app settings.

AC4: The tour creation workflow.

AC5: The supported object files that can be imported to generate AR Objects.

AC6: The features available on different devices due to performance or hardware limitations.

AC7: The provider of the maps/routing functionality

AC8: The algorithm used to determine which AR Objects should be rendered in the Realm Screen.

AC9: The render style of AR Objects (shaders/materials).

AC10: The interface layout for all the screens.

4.2 Unlikely Changes

The module design should be as general as possible. However, a general system is more complex. Sometimes this complexity is not necessary. Fixing some design decisions at the system architecture stage can simplify the software design. If these decision should later need to be changed, then many parts of the design will potentially need to be modified. Hence, it is not intended that these decisions will be changed.

UC1: The file format of AR Objects (including metadata).

UC2: The account details associated with a user.

UC3: Changes in login procedure (sequence of events to be carried out for a successful login to the application)

UC4: The types of users (General and Organization).

UC5: The game engine used (Unity for rendering and platform support)

5 Module Hierarchy

This section provides an overview of the module design. Modules are summarized in a hierarchy decomposed by secrets in Table 1. The modules listed below, which are leaves in the hierarchy tree, are the modules that will actually be implemented.

M1: Hardware Module

M2: Tutorial Module

M3: Inventory Module

M4: Sub-Realm Module

M5: Touring Module

M6: Tour List Module

M7: Tour Management Module

M8: Settings Module

M9: Help Module

M10: Friends Module

M11: Maps Module

M12: Realm Interface Module

M13: Object Importer Module

M14: Object Placement Module

M15: Object Interaction Module

M16: Object Render Module

M17: Collision Detection Module

M18: Restricted Area Detection Module

M19: Weather Detection Module

M20: Tour Proximity Detection Module

M21: Notifications Module

M22: REST API Connection Module

M23: Local Database Manager Module

M24: Data Sync Module

M25: Server Database Manager Module

M26: Authentication Module

Level 1	Level 2
Hardware-Hiding Module	Hardware Module
Behaviour-Hiding Module	Tutorial Module
	Inventory Module
	Sub-Realm Module
	Touring Module
	Tour List Module
	Tour Management Module
	Settings Module
	Help Module
	Friends Module
	Maps Module
	Realm Interface Module
	Object Importer Module
	Object Placement Module
	Object Interaction Module
	Object Render Module
	Collision Detection Module
	Restricted Area Detection Module
	Weather Detection Module
	Tour Proximity Detection Module
	Notifications Module
Software Decision Module	REST API Connection Module
	Local Database Manager Module
	Data Sync Module
	Server Database Manager Module
	Authentication Module

Table 1: Module Hierarchy

6 Connection Between Requirements and Design

The design of the system is intended to satisfy the requirements developed in the SRS. In this stage, the system is decomposed into modules. The connection between requirements and modules is listed in Table 5.

7 Module Decomposition

Modules are decomposed according to the principle of "information hiding" proposed by **?**. The *Secrets* field in a module decomposition is a brief statement of the design decision hidden by the module. The *Services* field specifies *what* the module will do without documenting *how* to do it. For each module, a suggestion for the implementing software is given under the *Implemented By* title. If the entry is *OS*, this means that the module is provided by the operating system or by standard programming language libraries. *Software Engineering* means the module will be implemented by the Software Engineering software.

Only the leaf modules in the hierarchy have to be implemented. If a dash (–) is shown, this means that the module is not a leaf and will not have to be implemented.

7.1 Hardware Hiding Modules (M1)

Secrets: The data structure and algorithm used to implement the virtual hardware.

Services: Serves as a virtual hardware used by the rest of the system. This module provides the interface between the hardware and the software, allowing the system to display outputs or accept inputs.

Implemented By: OS

7.1.1 Device Input/Output Module

Secrets: How data is collected from and sent to device sensors like the camera, GPS, or microphone.

Services: Provides a standard interface for capturing sensor input (e.g., photos, location data) and delivering it to the higher-level system modules.

Implemented By: OS

7.2 Behaviour-Hiding Module

Secrets: The contents of the required behaviours.

Services: Includes programs that provide externally visible behaviour of the system as specified in the software requirements specification (SRS) documents. This module serves as a communication layer between the hardware-hiding module and the software decision module. The programs in this module will need to change if there are changes in the SRS.

Implemented By: REALM

7.2.1 Tutorial Module (M2)

Secrets: The format and structure of the tutorial.

Services: Provides an interactive tutorial for a user to experiment with the core features of the app. The tutorial for individual features are also accessible.

Implemented By: REALM

Type of Module: Abstract Object

7.2.2 Inventory Module (M3)

Secrets: The format and structure of the inventory interface.

Services: Display's a list of available objects and allows for detailed previews of AR Objects and their associated metadata.

Implemented By: REALM

Type of Module: Abstract Object

7.2.3 Sub-Realm Module (M4)

Secrets: The format and structure of the Sub-Realms.

Services: Allows users to join and leave custom environments with controlled access management. Users with adequate permissions in a Sub-Realm can invite or remove other users. The default Sub-Realm is common between all users.

Implemented By: REALM

Type of Module: Abstract Object

7.2.4 Touring Module (M5)

Secrets: The format and structure of touring.

Services: Allows *General Users* to go on pre-made and geo-anchored tours by following a defined path that has AR objects placed along the route. Users can view the tours through the Realm Interface and Map views.

Implemented By: REALM

Type of Module: Abstract Object

7.2.5 Tour List Module (M6)

Secrets: The format and structure of the tour list.

Services: Display's a list of available tours and allows a user to view more details about a specific tour.

Implemented By: REALM

Type of Module: Abstract Object

7.2.6 Tour Management Module (M7)

Secrets: The format and structure of tour management.

Services: Display's a list of available tours and allows a user to view more details about a specific tour.

Implemented By: REALM

Type of Module: Abstract Object

7.2.7 Settings Module (M8)

Secrets: The format and structure of settings.

Services: Gives users the option to customize their experience and accommodate disabilities.

Implemented By: REALM

Type of Module: Abstract Object

7.2.8 Help Module (M9)

Secrets: The format and structure of the help page.

Services: Aides the user in understanding specific features or report issues within the app. The tutorial can also be launched from this module.

Implemented By: REALM

Type of Module: Abstract Object

7.2.9 Friends Module (M10)

Secrets: The format and structure of the friends functionality.

Services: Allows users to manage their friends. These friends can be added to Sub-Realms with the right permissions.

Implemented By: REALM

Type of Module: Abstract Object

7.2.10 Maps Module (M11)

Secrets: The format and structure of maps.

Services: Display's AR object locations superimposed on a 2D map of the area around the user. User can zoom in and out to see less or more objects.

Implemented By: REALM

Type of Module: Abstract Object

7.2.11 Realm Interface Module (M12)

Secrets: The structure and interaction of the Realm Interface.

Services: This is the primary interface that the user interacts with to start the placement or interaction with AR Objects and switch between Sub-Realms.

Implemented By: REALM

Type of Module: Abstract Object

7.2.12 Object Importer Module (M13)

Secrets: The structure and workflow of object importing.

Services: Scans of objects from external apps can be imported and turned into AR objects with the required additional metadata.

Implemented By: REALM

Type of Module: Abstract Object

7.2.13 Object Placement Module (M14)

Secrets: The structure and workflow of object placement.

Services: Allows a user to place an AR object in the world. The placement can be fine tuned after the initial location is selected.

Implemented By: REALM

Type of Module: Abstract Object

7.2.14 Object Interaction Module (M15)

Secrets: The structure and workflow of object interaction.

Services: Allows users to interact with existing AR objects in the world. They can add reactions, report, or save the objects to their inventory.

Implemented By: REALM

Type of Module: Abstract Object

7.2.15 Object Render Module (M16)

Secrets: The format and algorithm used to render AR objects.

Services: Balances the performance with the number and resolution of AR objects to ensure a fluid user experience.

Implemented By: REALM

Type of Module: Abstract Object

7.2.16 Collision Detection Module (M17)

Secrets: The format and algorithm to achieve collision detection.

Services: Uses device sensor data to detect when a user is close to a physical object and warn them to prevent a possible collision.

Implemented By: REALM

Type of Module: Abstract Object

7.2.17 Restricted Area Detection Module (M18)

Secrets: The format and algorithm to achieve restricted area detection.

Services: Display's places on the map where access to a certain area is restricted.

Implemented By: REALM

Type of Module: Abstract Object

7.2.18 Weather Detection Module (M19)

Secrets: The format and algorithm to achieve weather detection.

Services: Display's warnings for inclement weather in the area of the user.

Implemented By: REALM

Type of Module: Abstract Object

7.2.19 Tour Proximity Detection Module (M20)

Secrets: The format and algorithm to achieve tour proximity detection.

Services: Monitors the user's location to find when they are in close proximity to a tour.

Implemented By: REALM

Type of Module: Abstract Object

7.2.20 Notifications Module (M21)

Secrets: The structure and format of notifications.

Services: Sends notifications to the device if enabled.

Implemented By: REALM

Type of Module: Abstract Object

7.3 Software Decision Module

Secrets: The design decision based on mathematical theorems, physical facts, or programming considerations. The secrets of this module are *not* described in the SRS.

Services: Includes data structure and algorithms used in the system that do not provide direct interaction with the user.

Implemented By: REALM

7.3.1 REST API Connection Module (M22)

Secrets: The structure and format of the connection to the server REST API.

Services: Makes calls to and from the REST API running on the server.

Implemented By: REALM

Type of Module: Abstract Object

7.3.2 Local Database Manager Module (M23)

Secrets: The structure and format of the local database interface.

Services: Interacts with the local database by performing CRUD operations.

Implemented By: REALM

Type of Module: Record

7.3.3 Data Sync Module (M24)

Secrets: The structure and algorithm to sync data.

Services: Keeps the local app data and server data in sync.

Implemented By: REALM

Type of Module: Abstract Object

7.3.4 Server Database Manager Module (M25)

Secrets: The structure and format of the server database interface.

Services: Interacts with the server database by performing CRUD operations.

Implemented By: REALM

Type of Module: Record

7.3.5 Authentication Module (M26)

Secrets: The structure and format of the authentication.

Services: Verifies a user's credentials and which type of user they are (General/Organization user).

Implemented By: REALM

Type of Module: Abstract Object

8 Traceability Matrix

This section shows two traceability matrices: between the modules and the requirements and between the modules and the anticipated changes.

9 Use Hierarchy Between Modules

In this section, the uses hierarchy between modules is provided. **?** said of two programs A and B that A *uses* B if correct execution of B may be necessary for A to complete the task described in its specification. That is, A *uses* B if there exist situations in which the correct functioning of A depends upon the availability of a correct implementation of B. Figure 1 illustrates the use relation between the modules. It can be seen that the graph is a directed acyclic graph (DAG). Each level of the hierarchy offers a testable and usable subset of the system, and modules in the higher level of the hierarchy are essentially simpler because they use modules from the lower levels.
